

<p>Problem </p> <p><i>AI solutions make predictions based on data. What specific problem are you trying to solve? What exactly do you want to predict?</i></p>	<p>Value Proposition </p> <p><i>What is the value of this prediction? How will it be useful? (e.g save time, make it easier to do something?)</i></p>	<p>User/Customer </p> <p><i>Whom will this be valuable to? Why?</i></p>	<p>Actions </p> <p><i>What specific actions will be taken based on the prediction?</i></p>	<p>Outcome </p> <p><i>What happens after the prediction is made and action is taken? Are there any risks or potential downsides to consider?</i></p>
<p>Data </p> <p><i>AI relies on data for training. How do you ensure it can predict what you need? What data do you currently have, and is it sufficient to make this prediction? Where will the data come from, and how will you verify its quality, reliability, and relevance for your goal?</i></p>			<p>Competition </p> <p><i>Is someone else already doing this? How can your solution be better or more unique than theirs?</i></p>
